MAIN FEATURES

Preliminary estimates of average weekly earnings for November 1986 and the respective changes are shown below:

Full-time adult weekly ordinary time earnings

Change (%)

	<i>Average (\$)</i>	<i>Aug 1986 to Nov 1986</i>	<i>Nov 1985 to Nov 1986</i>
Males	453.00	+2.0	+8.0
Females	374.00	+2.9	+8.3
Persons	428.40	+2.3	+7.9

Full-time adult weekly total earnings

Change (%)

	<i>Average (\$)</i>	<i>Aug 1986 to Nov 1986</i>	<i>Nov 1985 to Nov 1986</i>
Males	489.00	+2.7	+7.8
Females	383.10	+3.0	+8.3
Persons	456.10	+2.8	+7.8

All employees weekly total earnings

Change (%)

	<i>Average (\$)</i>	<i>Aug 1986 to Nov 1986</i>	<i>Nov 1985 to Nov 1986</i>
Males	446.70	+2.2	+7.9
Females	288.00	+1.8	+7.3
Persons	381.40	+2.1	+7.3

Notes on the estimates

The survey results for November 1986 continue to reflect the effects of the payment of the 2.3 per cent National Wage Case increase (awarded in July 1986) to approximately 50 per cent of full-time adult employees comprising about 30 per cent of private sector and 75 per cent of public sector employees.

Two factors contributing to the larger increase in average weekly ordinary time earnings for full-time adult females compared with full-time adult males are:

- the reverse situation applied in August 1986, indicating that a higher proportion of males than females had received the National Wage Case increase by the August 1986 reference period; and
- the female earnings have been affected by a recent pay increase received by nurses in New South Wales.

The greater increase in average weekly total earnings than in ordinary time earnings for full-time adults is largely due to increased overtime earnings in the manufacturing industries.

Average weekly earnings may be affected significantly in some periods by changes in the composition of the labour force (see paragraph 12 below).

EXPLANATORY NOTES

Introduction

This publication contains preliminary estimates of average weekly earnings for November 1986 based on information obtained from a sample survey of employers.

2. Final estimates will be published in *Average Weekly Earnings, States and Australia, November 1986* (6302.0).

3. Background information about the average weekly earnings series is provided in *Information Paper: New Statistical Series: Employment, Average Weekly Earnings, Job Vacancies and Overtime* (6256.0) published on 21 June 1984, copies of which are available on request.

Scope of the survey

4. All wage and salary earners who received pay for the reference period are represented in the survey, except:

- members of the Australian permanent defence forces;
- employees of enterprises primarily engaged in agriculture, forestry, fishing and hunting;
- employees in private households employing staff;
- employees of overseas embassies, consulates, etc.;
- employees based outside Australia;
- employees on workers' compensation who are not paid through the payroll;
- directors who are not paid a salary;
- proprietors/partners of unincorporated businesses;
- self-employed persons such as subcontractors, owner/drivers, consultants and persons paid solely by commission without a retainer.

Survey design

5. A sample of approximately 4,000 employers is selected from the ABS register of businesses to ensure adequate State and industry representation. The sample is updated each quarter to take account of new businesses, those which have ceased operation and structural changes such as takeovers and mergers. The statistical unit for the survey comprises all activities of an enterprise in a particular State or Territory. Each

statistical unit is classified to an industry which reflects the predominant activity of the enterprise in the State or Territory. In a small number of cases where an enterprise has significant employment in more than one industry, a separate statistical unit is created for each industry. The statistical units are stratified by State, public/private, industry and size of employment and a simple random sample is selected from each stratum.

Definitions

6. *Reference period* for the survey refers to the last pay period ending on or before the third Friday of the middle month of the quarter. The reference date for the current survey is 21 November 1986.

7. *Employees* refers to all wage and salary earners (as defined in paragraph 4) who received pay for any part of the reference period.

8. *Full-time employees* are permanent, temporary and casual employees who normally work the agreed or award hours for a full-time employee in their occupation and received pay for any part of the reference period; if agreed or award hours do not apply, employees are regarded as full-time if they ordinarily work 35 hours or more per week.

9. *Adults* are those employees 21 years of age or over and those employees who, although under 21 years of age, are paid at the full adult rate for their occupation.

10. *Weekly ordinary time earnings* refers to one week's earnings of employees for the reference period attributable to award, standard or agreed hours of work. It is calculated before taxation and any other deductions (e.g. superannuation, board and lodging) have been made. Included in ordinary time earnings are award payments, over-award payments, penalty payments, shift and other allowances; commissions and retainers; bonuses and similar payments related to the reference period; payments under incentive or piecework; payments under profit sharing schemes normally paid each pay period; payments for leave taken during the reference period; all workers' compensation payments made through the payroll; and salary payments made to directors. Excluded are retrospective pay, pay in advance, leave loadings, severance pay, termination and redundancy payments and other payments not related to the reference period.

11. *Weekly total earnings* is equal to weekly ordinary time earnings plus overtime earnings.

12. *Average weekly earnings* statistics represent average gross (before tax) earnings of employees and do not relate to average award rates nor to the earnings of the 'average person'. Estimates of average weekly earnings are derived by dividing estimates of weekly total earnings by estimates of employment. Changes in the averages may be affected not only by changes in the level of earnings of employees but also by changes in the overall composition of the labour force. There are several aspects which can contribute to compositional changes such as variations in the proportions of part-time, casual and junior employees, variations in the occupational distribution within and across industries and variations in the distribution of employment between industries.

Comparability of results

13. When comparisons are made between period-to-period movements in average weekly ordinary time earnings (AWOTE) for full-time adults and movements in the Award Rates of Pay

Indexes (ARPI) it is important to recognise the different coverage, scope, definitions and methodology used in the construction of each series. In particular, the AWOTE series includes a number of payments additional to award rates of pay used in compiling ARPI. Allowances covered under awards which are not industry or occupation-wide in their application such as site, travelling, height and dirt allowances are excluded from ARPI but included in AWOTE. The AWOTE series also includes other payments, such as shift penalty payments and over-award pay. A significant number of employees are not covered by awards but are included in AWOTE. The AWOTE series is affected by compositional change in the labour force. However ARPI is not, because it is a fixed-weight index constructed from a representative 'basket' of occupations selected from the May 1976 Survey of Employee Earnings and Hours and subject to re-selection and re-basing at infrequent intervals. Other factors affecting comparisons of the two series include seasonal influences on earnings and differences between the two series in the treatment of retrospective pay increases. A detailed description of the methodology, scope and definitions used in ARPI is published in *Award Rates of Pay Indexes, Australia* (6312.0).

14. It is also important to recognise that whilst average employee earnings can be derived from the Survey of Employment and Earnings (SEE) published in *Employed Wage and Salary Earners, Australia* (6248.0), these average earnings will not be comparable with those produced from the Survey of Average Weekly Earnings (AWE). In the AWE survey, information is obtained relating to a specified pay period, the last pay period ending on or before the third Friday of the middle month of the calendar quarter. The SEE collects the sum of employee earnings paid in *all* pay periods ending in a calendar quarter including payments to employees which are excluded from the scope of the AWE survey such as retrospective pay and pay in advance, leave loadings, severance, termination and redundancy payments. Whilst the quarterly earnings produced by the SEE are affected by the varying number of pay periods from quarter to quarter the AWE results are unaffected because of the selection of a specified pay period in the middle of a quarter. The SEE earnings data are also more subject to seasonal variations, particularly in the December and March quarters, due to the incidence of holidays taken in January being paid in advance and the earnings being reported in December quarter figures.

Historical series

15. The series was introduced in August 1981 when it replaced the average weekly earnings series based principally on information from payroll tax returns. Revised estimates of average weekly earnings for the period August 1981 to November 1983 were included in *Average Weekly Earnings, States and Australia, March Quarter 1984* (6302.0) published on 12 July 1984. Users who need a measure of the movement in earnings for a period which spans both the payroll tax-based and employer survey series should refer to Table 3 in that publication which presents both series linked to a common index base (August 1981 = 100).

Reliability of estimates

16. As the estimates in this publication are based on information relating to a sample of employers rather than a full enumeration, they are subject to sampling variability. That is, they may differ from the figures that would have been produced if the information had been obtained from all employers. This

difference, called *sampling error*, should not be confused with inaccuracy that may occur because of imperfections in reporting by respondents or in processing by the ABS. Such inaccuracy is referred to as *non-sampling error* and may occur in any enumeration whether it be a full count or sample. Efforts have been made to reduce non-sampling error by careful design of questionnaires, detailed checking of returns and quality control of processing.

17. The sampling error associated with any estimate can be estimated from the sample results. One measure of sampling error is given by the *standard error* which indicates the degree to which an estimate may vary from the value that would have been obtained from a full enumeration (the 'true' figure). There are about two chances in three that a sample estimate differs from the true value by less than one standard error, and about nineteen chances in twenty that the difference will be less than two standard errors.

18. An example of the use of a standard error for November 1986 estimates is as follows. Table 1 shows the estimate of average weekly total earnings for all employees in Australia for November 1986 as being \$381.40. The estimated standard error associated with this figure is \$2.20. Therefore, there are about two chances in three that a full enumeration would give a figure in the range \$379.20 to \$383.60 and about nineteen chances in twenty that it would be in the range \$377.00 to \$385.80.

19. An example of the use of a standard error for a quarterly change estimate is as follows. Table 1 shows the estimated standard error for the quarterly change estimate of average weekly total earnings for all employees in Australia as being \$1.70. The quarterly change estimate between August 1986 and November 1986 is \$7.70 (\$381.40 minus \$373.70). Therefore there are about two chances in three that a full enumeration would give a quarterly change figure in the range \$6.00 to \$9.40 and about nineteen chances in twenty that it would be in the range \$4.30 to \$11.10.

21. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.

Unpublished statistics

22. In some cases, the ABS can also make available information which is not published. This information may be made available in one or more of the following forms: microfiche, photocopy, data tape, computer printout, clerically-extracted tabulation. Generally, a charge is made for providing unpublished information. Inquiries should be made to the officer whose name appears in the *Phone Inquiries* section of the Inquiries box at the front of this publication, or to Information Services in the nearest ABS Office.
